# IEM Events App

The college organises various events, seminars, conferences, talks and workshops all round the year. All the information regarding these are shared via whatsapp or email. Sometimes it becomes inconvenient for the students and teachers to keep track of a number of events simultaneously. This may lead to spamming and loss of relevant information.

To solve this problem we shall be creating a mobile application that will provide one-click access to all the events in the college. Users shall be able to know about the current and upcoming events at the college. The admin can create new events and moderate existing ones. Technologies used are Android Framework and Firebase.
